# L'AZIENDA

Da oltre mezzo secolo Rime è sinonimo di tecnologia e innovazione. Gli elevati standard qualitativi, la ricerca continua e il controllo della produzione che si svolge interamente nel nostro stabilimento di Villa Carcina, fanno di Rime uno dei più affidabili player tecnologici nel settore degli utensili Standard e Speciali in HSS e Metallo Duro.

# THE FACTORY

For over half a century Rime has been synonymous of technology and innovation. High quality standards, continuous research and production control, which is carried out entirely in our Villa Carcina factory, make Rime one of the most reliable technological players in the field of HSSCo-PM and Solid Carbide Cutting Tools, Standard and Special.

# RICERCA E QUALITÀ

## RESEARCH & QUALITY

100%

Made in Europe

Per mantenere elevati standard qualitativi monitoriamo costantemente la filiera dei partner tecnologici: dai fornitori delle materie prime, ai nuovi materiali di rivestimento, ai centri di affilatura sempre di ultima generazione, fino alla robotizzazione dei sistemi di produzione.

In order to maintain high quality standards, we constantly monitor the supply chain of our technological partners: from raw material suppliers, to new coating materials, to the latest generation of grinding centres and the robotisation of production systems.

100%

Made in Italy

Il settore di Ricerca e Sviluppo assume oggi un valore centrale nella nostra azienda. L'uso dei più avanzati simulatori grafici ci consente di sperimentare virtualmente nuove geometrie e di ingegnerizzare completamente il processo produttivo.

Today, the Research and Development sector has a central value in our company.

The use of the most advanced graphic simulators allows us to experiment virtually with new geometries and to fully engineer the production process.

Sistemi e macchinari sempre aggiornati per il controllo della qualità consentono di mantenere la produzione ai massimi livelli qualitativi.

Systems and machinery always updated for quality control allow us to maintain the production at the highest quality level.

Siamo certificati  
ISO 9001 dal 2010.

We are certified  
ISO 9001 since 2010.

## SERVICE & CSR

**Rime**  
advanced tools production

#### RIAFFILATURA E RICOPERTURA

La nostra azienda da sempre offre un servizio rapido di rigenerazione, con riaffilatura e rivestimento degli utensili prodotti. L'utilizzo di macchine affilatrici CNC di ultima generazione, di sistemi di controllo micrometrici e di personale dedicato altamente qualificato, garantiscono elevata qualità ed estrema rapidità nei tempi di esecuzione.

#### REGRINDING AND COATING

Our company has always offered a quick regeneration service, with regrinding and recoating of its cutters. The use of the latest generation of CNC grinding machines, micrometric control systems and dedicated highly professional staff with decades of experience guarantee high quality and extremely fast turnaround times.

#### MAGAZZINO

Tutti gli utensili standard a catalogo sono sempre a magazzino e in pronta consegna.

#### WAREHOUSE

All standard end mills are always in stock and ready for delivery.

#### TEMPI DI CONSEGNA

Per le frese a magazzino i tempi di consegna sono rapidissimi. La consegna avviene mediamente entro 24/48 ore.

#### DELIVERY TIMES

For milling cutters in stock, delivery times are very fast. The average delivery time is 24/48 hours.

#### RESPONSABILITÀ SOCIALE D'IMPRESA

Da sempre Rime è sensibile alle tematiche legate alla salvaguardia dell'ambiente. In tutti gli ambiti produttivi, la politica "green" che ci siamo imposti è perseguita con la massima attenzione.

In tutte le nostre fasi di lavorazione vengono seguite precise procedure e vengono utilizzati sistemi di recupero degli scarti di produzione e di risparmio energetico che ci permettono il rigoroso rispetto dell'ambiente e di tutte le norme relative alla sostenibilità ambientale.

Un grande parco fotovoltaico copre buona parte del nostro fabbisogno energetico e sofisticati impianti di recupero rigenerano i lubrificanti utilizzati durante la produzione.

#### CORPORATE SOCIAL RESPONSIBILITY

Rime has always been sensitive to environmental protection issues. In all production areas, we pay attention to the green policy that we have imposed on ourselves. For all stages of processing, precise procedures are followed and systems are used for the recovery of production waste and energy saving that allow us to strictly respect the environment and all the rules relating to environmental sustainability. A large photovoltaic park covers a large part of the energy we need and sophisticated recovery plants regenerate the lubricants used during production.

# PRODUZIONE PRODUCTION

Produciamo utensili standard in HSS e Metallo Duro ed utensili speciali. Negli ultimi anni il peso degli utensili speciali ha assunto una grande importanza, grazie alla collaborazione con grandi aziende che hanno favorito il processo di crescita del nostro know-how.

I nostri cataloghi propongono un'offerta molto ricca e articolata di prodotti standard, disponibili sempre a magazzino. Soluzioni di qualità assoluta in ogni settore delle lavorazioni meccaniche in cui sono richieste grande precisione ed elevate prestazioni.

*We produce standard tools in HSS and hard metal as well as special tools. In recent years, the production of special tools has taken on great importance, thanks to collaboration with large companies that have supported the growth of our know-how.*

*Our catalogues propose a very rich range of standard products always available in stock. We supply quality solutions in every sector of mechanical processing where high quality and high performance are required.*

## FRESE E ALESATORI IN HSS CO-PM

Il nostro catalogo di utensili in HSS-E e PM è ad oggi uno dei più completi sul mercato per tipologia e numero di articoli offerti. Tutta la gamma dei prodotti viene realizzata con acciai della migliore qualità e provenienti dalla Comunità Europea.

L'abbinamento a rivestimenti di ultima generazione consentono di ottenere le massime prestazioni.

## FRESE E ALESATORI IN METALLO DURO

Il catalogo di utensili in Metallo Duro si arricchisce di continuo per tipologia di utensili e per misure. Attualmente l'applicazione di geometrie complesse e l'utilizzo di rivestimenti di ultima generazione consentono ai nostri utensili di poter lavorare qualsiasi tipo di materiale ad elevate prestazioni in sicurezza. Anche per il Metallo Duro tutte le referenze sono a magazzino per un veloce servizio di consegna.

## HSS CO-PM END MILLS AND REAMERS

Our catalogue of HSS-E and PM cutting tools is one of the most complete on the market in terms of the number of items and range offered.

All our production range is made with the best steels coming from European Union.

We match them with the best coatings of last generation, so that we get excellent performances.

## SOLID CARBIDE END MILLS AND REAMERS

The catalogue of solid carbide tools is constantly expanding in terms of tool types and sizes. Complex geometry mixed with the last generation of coatings make it possible to machine any type of material at highest performance in total safety.

All references for solid carbide are also in stock for a fast delivery service.

## Frese Speciali

Mezzo secolo di esperienza e prestigiose collaborazioni con aziende nazionali e internazionali di rilievo ci hanno permesso di raggiungere un elevato standard qualitativo.

Oggi progettiamo utensili per dare soluzioni innovative in applicazioni dove sono richieste un elevato grado di specializzazione, qualità e affidabilità. Grazie ad un moderno e sempre aggiornato parco macchine siamo in grado di realizzare utensili di ogni tipo per vari settori, sia in piccole sia in grandi serie. Realizziamo utensili partendo da materie prime diverse: Metallo Duro, HSS-Co e ASP (acciaio sinterizzato da polveri). Tra gli utensili prodotti troviamo: frese a cannela, frese di forma, frese a manicotto, frese a disco, frese a "T", microfrese, punte cilindriche, punte a gradino, punte coniche, alesatori di forma, frese e alesatori in metallo duro saldo brasato, allargatori, stozzatori, lamatori, piccole brocche, punzoni, bulini, ecc. Negli anni la nostra azienda si è specializzata in alcuni ambiti e in particolare:

Settore Energia  
 Settore Automotive  
 Settore Armiero  
 Settore Aeronautico  
 Settore Stampi e Matrici

## Special Milling Cutters

Years of experience and a lot of prestigious collaborations with national and international companies have allowed us to achieve a very high level of quality of our products.

Today, thanks to a very modern and updated park machines, we are capable of manufacturing cutting tools of each type for various sectors, both in small and large series, designed to meet solutions where it is required a high degree of specialization, quality and reliability.

We manufacture cutting tools in HSS-Co, ASP (sintered powder steel) and in Solid Carbide as well. We produce milling cutters, form cutters, milling cutters sleeve, disc cutters, conical spot facers, "T" shape cutters, micro-end mills, step drills, taper drills, reamers shape, milling cutters and reamers brazed, countersinks, shaper, small broaches, punches, chisels, etc..

Over the years we have been specialized in certain sectors, particularly:

Energy  
 Automotive  
 Army  
 Aeronautical  
 Moulds and Dies

## MATERIALI BASE RAW MATERIAL

### Materiali utilizzati per la costruzione delle frese RIME

#### \* HSS/Co5 AISI M35

Acciaio ad elevato rendimento, permette una buona elasticità di lavorazione. Adatto per utensili soggetti ad urti.

#### HSS/Co8 AISI M42

Acciaio più utilizzato nella costruzione di frese; la sua elevata durezza, unita ad una buona tenacità e resilienza, consente la lavorazione degli acciai ad alta resistenza. Ottimo impiego nelle lavorazioni difficili con i rivestimenti TICN, TIALN e SUPREME di nuova generazione.

#### EMP3 PM Co8,5

Acciaio super rapido ottenuto con la metallurgia delle polveri; la struttura molto sottile di questo acciaio offre elevata tenacità ed elevata resistenza all'usura. Ottimo rendimento con il rivestimento SUPREME di nuova generazione.

#### EMP6 PM

Acciaio super rapido ottenuto con la metallurgia delle polveri con ottime caratteristiche di resistenza all'usura e durezza a caldo.

Il suo altissimo tenore di leghe gli consente prestazioni eccellenti nelle lavorazioni più difficili. Associato al rivestimento SUPREME dà il massimo del rendimento.

### Raw material used to manufacture RIME end mills

#### \* HSS/Co5 AISI M35

High-efficiency steel allowing a good cutting speed and a good machining elasticity. Suitable for tools subjected to shocks.

#### HSS/Co8 AISI M42

Steel mainly used in manufacturing of end mills. Its great hardness along with its good toughness and impact resistance allows to machine high-resistance steels. Very good efficiency with TICN, TIALN and SUPREME coatings of the new generation.

#### EMP3 PM-Co8,5

PM sintered high-speed steel. Its very thin shape offers a great toughness and wear resistance. Very good efficiency with SUPREME coating of the new generation.

#### EMP6 PM

High-speed steel got by powder metallurgy. Characteristic of very good wear resistance and hot hardness. Its very high alloy content allows very good performances in the most difficult machinings.

When used with SUPREME coating, it gives the top performances.

# SERIE UMAX

Frese per sgrossatura e finitura

Roughing and finishing end mills

	pag.
UM0 	112
UM1 	113
UM4 	114
UM5 	115
UM7 	116
UM8 	117

## Serie UMAX

La fresa UMAX è una fresa universale pertanto può eseguire lavori sia di sgrossatura sia di finitura.

Principali caratteristiche della fresa UMAX:

- 1) grande capacità di asportazione di truciolo anche da materiali molto difficili
- 2) con la stessa fresa si ottiene un'ottima finitura.

## UMAX Series

UMAX end mills are universal mills, which can carry out different roughing and finishing workings.

The main characteristics of UMAX end mills are as follows:

- 1) they can easily remove shaving also from very difficult materials
- 2) a very good finishing degree can be granted by using the same end mill.

- FRESE A DUE DENTI - Un dente frontale tagliente fino al centro - Lavorazione di alluminio, leghe leggere, materiali teneri e malleabili - Codolo cilindrico
- TWO-FLUTES END MILLS - One end tooth cutting up to the centre - To machine aluminium, light alloys - Straight shank
- FRAISES À CYLINDRES DEUX DENTS - Une dent bout coupante jusqu'au centre - Pour l'usinage de aluminium, alliages légers - Queue cylindrique
- SCHAFTFRÄSER, ZWEISCHNEIDER - Eine Schneide mit Zentrumschnitt - Zur Bearbeitung von Aluminium, Leichtlegierungen - Zylinderschaft
- FRESAS CILINDRICAS DOS LABIOS - un labio que cortan hasta el centro - Para mecanizar el aluminio y ligas ligeras - Mango cilíndrico
- FRESAS CILINDRICAS DUAS NAVALHAS - um naval que corta hasta el centro - Para mecanizar el aluminio y ligas ligeras - Encabadouro cilíndrico
- Фреза 2-х зубая для работ по алюминию, легким сплавам, хрупким и пластичным материалам. Режущий торец. Цилиндрический хвостовик. Средняя серия

A close-up, high-contrast photograph of a metal cutting tool, likely a lathe tool, in the process of machining a workpiece. The tool is positioned diagonally, and a bright, curved chip of metal is being removed from the workpiece, creating a sharp, reflective surface. The background is dark, emphasizing the metallic textures and the precision of the manufacturing process.

### FRESE A TESTA SEMISFERICA PER SGROSSATURA E SEMIFINITURA

NORM	TIPO-TYPE	Z4÷7
ISO 1641/II	SHORT NORMAL LONG EXTRA-LONG	

#### NORMALE

## MG24

- FRESE A TESTA SEMISFERICA PER SGROSSATURA E SEMIFINITURA - Denti elicoidali con rompitrucciolo spogliato completamente rettificato - Due denti frontali taglienti fino al centro - Codolo conico Morse con foro filettato
- ROUGHING END MILLS - Helical teeth with form relieved entirely ground chip-breaker - Two end teeth cutting up to the centre - Morse taper hank
- FRAISES FRONTALES À CYLINDRES À DEGROSSIR - Denture hélicoïdale avec brise-copeaux - Deux dents bout coupantes jusqu'au centre - Queue au cône Morse à trou fileté
- SCHAFTFRÄSER - Schrägschneiden mit voll eingeschliffenem Spannbrecher - Zwei Schneiden mit Zentrumschnitt Morsekegelschaft und Anzugsgewinde
- FRESAS CILINDRICAS FRONTALES CABEZA SEMIESFÉRICA PARA DESBASTE Y SEMI ACABAR - Labios helicoidal con arranque de viruta - Dos labios que cortan hasta el centro - Mango cónico Morse taladro roscado
- FRESAS CILINDRICAS FRONTALES BOLEADA PARA DESBASTE E SEMI ACABAMENTO - Navalhas helicoidal com quebra aparas - Duas navalhas que cortan hasta el centro - Encabadouro conico - Morse taladro roscado
- Фреза для черновой и получистовой обработки со стружколомом. Сферический торец. Хвостовик конус Морзе с резьбой. Средняя серия

## Dati di taglio per frese RIME in HSS Co8 - EMP3 EMP6

I valori espressi sulle tabelle alle pagine seguenti devono essere considerati come indicativi e usati come aiuto per ottenere i migliori risultati nell'impiego delle nostre frese.

Dalle tabelle si può rilevare la combinazione più adatta per ricavare velocità di taglio, numero dei giri e di avanzamento con corrispondente profondità e larghezza di taglio relativamente al diametro delle frese da impiegare.

I tipi di materiale da lavorare sono divisi in 6 gruppi. Ogni gruppo comprende qualità di materiali che presentano valori simili di truciolabilità.

Nella scelta dei dati di taglio occorre tenere presente il gruppo a cui appartiene il materiale.

Normalmente è necessario un adattamento dei dati di taglio così trovati con quelli consentiti dalle macchine utensili a disposizione.

## Le premesse per un'esatta applicazione dei dati di taglio

- 1) Impiego delle frese RIME in HSS/Co8 - EMP3 - EMP6
- 2) I valori di taglio indicati valgono per frese a codolo cilindrico con lunghezza di taglio media e corta. (Valori iniziali  $\pm 15\%$ ).  
Per le frese con taglio lungo l'avanzamento deve essere ridotto del 40%, per le frese extralunghe del 60%, mentre la velocità di taglio va ridotta del 20%
- 3) Uso di un liquido di raffreddamento adatto (generalmente emulsione).
- 4) Macchina operatrice, bloccaggio del pezzo in lavorazione e dell'utensile devono essere stabili onde evitare pericolose vibrazioni.

## Adeguamento numeri giri ed avanzamento alla fresatrice

Le fresatrici in uso hanno generalmente possibilità di selezionare sia numero di giri del mandrino che gli avanzamenti.

I valori rilevati dalle tabelle di taglio, nella maggior parte dei casi, devono essere adattati ai valori della macchina operatrice.

Gli aggiustamenti devono essere tali da non variare sensibilmente il carico per dente.

## Data on cutting rate of RIME end mills in HSS Co8 EMP3 - EMP6

The data shown in the tables hereafter shall be only indicative and used as a support to get the best performances by RIME end mills.

Therefore, the tables can be helpful in finding the most suitable combination of cutting speed, number of revolutions per minute and feed progress with relevant cut depth and width with regard to diameter of the end mills to be used.

The types of metals to be machined are divided into 6 groups. Each group includes metal quality classes having similar "chipability" rates.

When choosing a certain cutting class, always keep in mind the group the metal is part of.

However, the data on cutting rate herein generally need to be matched to the machine tools available.

## To get a suitable application of cutting data the directions hereafter shall be followed

- 1) use RIME HSS/Co8 - EMP3 - EMP6;
- 2) the cutting rates herein shown are referred to end mills with cylindrical shaft having an average and short cut length. (starting rates  $\pm 15\%$ ).  
If end mills have extra -long cut then the feed has to be reduced of 60%; for the end mills with long cut the feed has to be reduced of 40%; for both cases (long and extra-long cut) the cutting speed has to be reduced of 20%.
- 3) use a suitable coolant (normally an emulsion);
- 4) machine tool, clamping of the piece machined and tool shall be stable, so to prevent any dangerous vibrations.

## Adjustment of the number of revolutions and feed on a milling machine

The milling machines now available normally allow to select both the number of mandrel revolutions and feed.

Most of the values shown in the tables hereafter shall be adjusted to the values of the machine.

Every adjustment shall be so not to change the load on each flute considerably.

## GRUPPI DI MATERIALI DA LAVORARE - GROUPS OF MATERIALS TO BE MACHINED

L'industria di costruzione di componenti metallici richiede sempre più tipi di materiali con caratteristiche molto specifiche per ottenere prodotti di eccellenza con caratteristiche fisico-chimiche il più idonee possibile alla singola applicazione. Trattamenti termici e leganti influenzano notevolmente la geometria dell'utensile da utilizzare e relativi parametri di taglio.

I materiali sono quindi stati suddivisi secondo degli standard ISO in sei grandi gruppi per specifiche legate alla lavorabilità.

**ISO P:** Gruppo di acciai più ampio, comprende materiali poco legati fino a materiali molto legati. Si possono trovare getti di acciaio, acciai inossidabili ferritici e martensitici, acciai con diverso tenore di carbonio e durezza differenti. Tendenzialmente hanno una buona lavorabilità.

**ISO H:** Gruppo di acciai identificato dalla durezza compresa tra i 45 e 65 HRC e delle ghise fuse in conchiglia con durezza nell'ordine dei 400-600HB. La loro caratteristica è l'elevata durezza e per questo sono di difficile lavorabilità. Il tagliente soffre a causa dell'azione abrasiva e della generazione di calore.

**ISO M:** Gruppo di acciai inossidabili con un minimo di Cr del 12% ed altre leghe come Ni e Mo. Si trovano acciai ferritici, martensitici, austenitici e austenitico-ferritici (Duplex). La lavorabilità di questi materiali è influenzata negativamente da una grande quantità di calore rilasciato al tagliente, da fenomeni di usura ad intaglio e tagliente di riporto.

**ISO K:** Gruppo di materiali che comprende le ghise grigie, le ghise malleabili, le ghise nodulari, le ghise a grafite compatta e austemperate. La lavorabilità varia a seconda della resistenza e della durezza ed è caratterizzata da un truciolo corto e da una forte azione abrasiva dovuta al contenuto di Si.

**ISO S:** Gruppo di materiali che comprende le Superleghe Resistenti al Calore (HRSA) e leghe di Titanio. Sono materiali fortemente legati a base di Fe, Ni, Co e Ti. La lavorabilità è molto ridotta in quanto sono materiali con tendenza all'incollamento, che creano taglienti di riporto e che si incrudiscono durante la lavorazione generando molto calore. Sono simili ai materiali del gruppo M, ma decisamente più difficili da lavorare.

**ISO N:** Gruppo di metalli non ferrosi come l'alluminio, il rame, l'ottone, ecc. Hanno una buona lavorabilità anche con velocità di taglio elevate. Nelle leghe di alluminio l'azione abrasiva è dettata dalla presenza di Si oltre il 10-13%.

*The manufacturing industry of metal components requires more and more types of materials with specific characteristics to get products with excellent physical-chemical characteristics suitable for the single application.*

*Thermal treatments and binders greatly influence the geometry of the tool to be used and related cutting parameters. The materials have been divided according to the ISO standard into six major groups related to specific workability.*

**ISO P:** *Wide group of steels including low and high alloy materials.*

*You can find steel castings, ferritic and martensitic stainless steels, steels with different carbon content and different hardness. Usually they have a good workability.*

**ISO H:** *Group of steels identified by the hardness between 45 and 65 HRC and chill cast irons with hardness in the range of 400-600 HB. Their characteristic is its high hardness and therefore are difficult to machine.*

*The cutting edge suffers due to the abrasive action and heat generation.*

**ISO M:** *Group of stainless steels with a minimum of 12% of Cr and other alloys such as Ni and Mo.*

*You can find ferritic, martensitic, austenitic and austenitic-ferritic (duplex) steels.*

*The machinability of these materials is negatively affected by a large amount of heat released on the cutting edge, by effects of notch wear and built-up edge.*

**ISO K:** *Group of material including gray cast iron, malleable cast iron, the nodular cast iron, compacted graphite cast iron and austemperate.*

*The workability varies according to the strength and hardness and is characterized by a short chips and a strong abrasive action due to the content of Si.*

**ISO S:** *Group of materials including Heat Resistant Super Alloys (HRSA) and Titanium Alloys. They are strongly bound to the base of Fe, Ni, Co and Ti.*

*The workability is very low as they are sticky materials, which create edges and that work-harden during machining generating much heat. They are similar to the materials of the group M, but much more difficult to work.*

**ISO N:** *Group of non-ferrous metals such as aluminium, copper, brass and so on.*

*They have a good workability even with high cutting speeds.*

*With aluminium alloys, the abrasive action depends on the presence in amounts more than 10-13% of the content of Si.*

## MATERIALI - MATERIALS

### Acciai (ISO P)

L'acciaio è una lega composta da ferro (elemento principale) e carbonio con percentuale non superiore a 2,06%.

Esso può essere non legato quando ha un tenore di carbonio inferiore allo 0,8% ed è costituito esclusivamente da ferro (Fe), senza altri elementi leganti.

L'acciaio legato, invece, ha un tenore di carbonio inferiore all'1,7%, e contiene elementi leganti come Ni, Cr, Mo, V e W.

Gli acciai legati si distinguono in debolmente legati, quando gli elementi leganti sono presenti in quantità inferiore al 5%, e in fortemente legati, quando gli elementi leganti sono presenti in quantità superiore al 5%.

Gli acciai possono essere non trattati, temprati o rinvenuti (bonificati) con una durezza nell'ordine di 400 HB.

Gli elementi leganti, il trattamento termico e il processo di fabbricazione influiscono sulla lavorabilità dell'acciaio.

Negli acciai a basso tenore di carbonio vi è una tendenza maggiore all'incollamento del truciolo.

La lavorabilità degli acciai debolmente legati dipende dal tenore di lega e dal trattamento termico a cui sono stati sottoposti (durezza). I materiali trattati producono più calore durante la lavorazione, che può provocare una deformazione plastica del tagliente.

Negli acciai fortemente legati la lavorabilità, in generale, è inversamente proporzionale al tenore di carbonio e alla durezza. Anche per questi acciai il rischio è l'eccessiva produzione di calore che può provocare deformazione plastica del tagliente.

Le forze di taglio e quindi la potenza richiesta per lavorarli restano comunque contenute.

### Steels (ISO P)

*Steel is an alloy composed by iron (main element) and carbon with a percentage no more than 2,06%. It can not be tied when it has a carbon content less than 0.8% and is made up exclusively of iron (Fe), without other alloying elements.*

*However the stainless steel has a carbon content of less than 1,7% and contains alloying elements such as Ni, Cr, Mo, V and W.*

*Alloy steels are divided into weakly bound, when alloying elements are present with a percentage less than 5% and strongly bound when alloying elements are present in percentage greater than 5%.*

*The steels can be not-treated, hardened or tempered (quenched steel) with a hardness in the range of 400 HB.*

*The alloying elements, the heat treatment and the manufacturing process affect the machinability of the steel.*

*Steels with low carbon content have a greater tendency to stick the chip.*

*The machinability of low-alloy steels depends on the alloy content and heat treatment to which they were subjected (hardness). The treated materials produce more heat during processing, which may cause a plastic deformation of the cutting edge.*

*Usually the machinability of the high-alloy steels is inversely proportional to the carbon content and hardness. Even for these steels the excessive production of heat may cause plastic deformation of the cutting edge.*

*The cutting forces and consequently the required power to machine them should not be high.*

## Acciai temprati e ghise fuse (ISO H)

A questo gruppo di materiali appartengono acciai temprati e rinvenuti con durezza >45< 68 HRC, acciai da costruzione (40 – 45 HRC), acciai da cementazione (~60 HRC), acciai per utensili (~68 HRC), ghise fuse (>50 HRC). In finitura, il truciolo risulta abbastanza controllabile. Un problema riscontrabile potrebbe essere un'usura maggiore del tagliente ed una deformazione plastica dello stesso. Le forze di taglio e le potenze richieste sono molto elevate.

### Hardened steels and cast irons (ISO H)

Quenched and tempered steels with a hardness >45<68 HRC are under this group of materials. Structural steel (40-45 HRC), case hardened steel (~60 HRC), tool steel (~68 HRC), molten cast iron (>50 HRC).

During the finishing the chip is quite controllable. A problem could be an important wear and a plastic deformation of the cutting edge. The cutting forces and the required power are very high.

## Acciai inossidabili (ISO P5/P6 e ISO M)

Gli acciai inossidabili hanno il ferro (Fe) come elemento principale, un tenore di carbonio basso ( $C \leq 0,05\%$ ) e un tenore di Cromo >12%.

Con aggiunte di nichel (Ni), cromo (Cr), molibdeno (Mo), niobio (Nb) e titanio (Ti), è possibile ottenere caratteristiche diverse, come la resistenza alla corrosione e la resistenza alle alte temperature.

Il cromo combinandosi con l'ossigeno (O) crea uno strato passivante di  $Cr_2O_3$  sulla superficie dell'acciaio, che rende il materiale resistente alla corrosione.

La lavorabilità dell'acciaio inossidabile varia a seconda degli elementi leganti, dei trattamenti termici e dai processi di fabbricazione. In generale, la lavorazione genera truciolo lungo.

Gli acciai inossidabili si distinguono principalmente per il tipo di microstruttura: ferritica, martensitica, austenitica, austeno-ferritica (duplex). Il controllo truciolo è abbastanza buono nei materiali ferritici e martensitici (lavorabilità ISO P), mentre diventa più problematico nelle versioni austenitiche e duplex (ISO M).

La lavorazione genera forze di taglio elevate, tagliente di riporto, calore e superfici incrudite.

Con un alto tenore di carbonio (>0,2%) l'usura sul fianco è relativamente accentuata.

La struttura austenitica ad alto tenore di azoto (N) determina una lavorabilità inferiore, mentre si ha un maggiore incrudimento per deformazione. Il molibdeno (Mo) e l'azoto (N) aumentano la resistenza alla corrosione e la resistenza alle alte temperature, ma determinano una diminuzione della lavorabilità.

Aggiungendo del Ni ad un acciaio inox ferritico a base di Cr si ottiene una matrice a base mista contenente sia ferrite che austenite. Il materiale risultante è detto duplex.

I materiali duplex hanno un'elevata resistenza sia a trazione sia alla corrosione, ma hanno una lavorabilità generalmente scarsa.

### Stainless steel (ISO M and ISO P5/P6)

The main element of the stainless steel is the iron (Fe); stainless steel has also a low content of carbon ( $C \leq 0.05\%$ ) and a content of Chrome >12%.

With additions of nickel (Ni), chromium (Cr), molybdenum (Mo), niobium (Nb) and titanium (Ti), it is possible to obtain different characteristics, such as resistance to corrosion and resistance to high temperatures.

The chromium combining with oxygen (O) creates a passivating layer of  $Cr_2O_3$  on the surface of the steel, which makes the material resistant to corrosion.

The machinability of stainless steel varies depending on the alloying elements, on heat treatments and on manufacturing process. In general, the process generates long chips. Stainless steels are distinguished mainly by the type of microstructure: ferritic, martensitic, austenitic, austenitic-ferritic (duplex).

The control of the chip is quite good in ferritic and martensitic steels (machinability ISO P), while is more problematic in austenitic and duplex (ISO M)

The process generates high cutting forces, built-up edge, heat and work-hardened surfaces.

		1.4545	15-5 PH	
	X7CrNiAl17-7	1.4564	17-7 PH	

When carbon content is high (> 0.2%) the flank wear is important.  
 The austenitic structure with a high content of nitrogen (N) determines a lower machinability, while it has a higher strain hardening.  
 The molybdenum (Mo) and nitrogen (N) determine a decrease in the machinability while increasing the resistance to high temperatures  
 By adding Ni to a ferritic stainless steel based on Cr is obtained a matrix based mixed containing both ferrite and austenite. The resulting material is called duplex.  
 The duplex materials have a high resistance both to the traction and corrosion, but generally they have a poor workability.

## M

### Ghisa (ISO K)

La ghisa è un composto di Fe-C con una percentuale di carbonio superiore al 2.06% e con una percentuale relativamente elevata di Si (1-3%). Il cromo (Cr), il molibdeno (Mo) e il vanadio (V) formano dei carburi, che aumentano la resistenza e la durezza, riducendo però la lavorabilità. La lavorazione produce trucioli corti ed un buon controllo degli stessi nella maggior parte delle condizioni. La forza di taglio può variare da 790 – 1350 N/mm<sup>2</sup>. Le lavorazioni a velocità elevate, specialmente nelle ghise con inclusioni di sabbia, provocano usura da abrasione. Le ghise generalmente vengono lavorate a secco, ma possono essere utilizzate anche in condizioni "umide", sostanzialmente per ridurre al minimo la contaminazione delle polveri dovuta al carbonio e al ferro.

### Cast iron (ISO K)

Cast iron is made by Fe-C with a carbon percentage higher than 2.6% and with a high percentage of Si (1-3%). The chromium (Cr), the molybdenum (Mo) and the vanadium (V) creates carbides, which increase the strength and hardness, while reducing the machinability. The process produces short chips and, in the majority of the cases, a good checking of them. The cutting force can vary from 790 - 1350 N / mm<sup>2</sup>. The machining at high speeds, especially in cast irons with sand, causing abrasive wear. Usually cast irons are dry processed, but can also be used in "wet", in order to minimize the contamination of dust from carbon and iron.

	GJSA-XNi35	0.7683		
	GMB 65	0.8065		

### Superleghe e leghe in titanio (ISO S)

Questo gruppo contiene Superleghe a base di ferro, nichel e cobalto, resistenti al calore (HRSA), e leghe di titanio.

- Le superleghe hanno un'elevata resistenza alla corrosione e ciò permette di mantenere la loro durezza e resistenza alle alte temperature (fino a 1000°C).

La versione a base di nichel è quella più utilizzata. Tra i materiali induriti per precipitazione figurano: Inconel, Waspalloy, Udimet. Tra i materiali induriti per solubilizzazione (non temprabili) figura l'Inconel 625.

I materiali a base di ferro derivano dagli acciai inossidabili austenitici e sono quelli che presentano la minore resistenza al calore.

La lavorabilità è migliore nel caso di leghe a base di ferro e risulta inferiore nel caso di leghe a base di nichel e a base di cobalto.

Essendo materiali con un'elevata resistenza alle alte temperature durante la lavorazione si producono trucioli segmentati.

La forza di taglio può variare da 2400-3100 N/mm<sup>2</sup>.

La notevole resistenza, la tendenza ad incrudimento e ad indurimento per adesione determinano fenomeni di usura per il tagliente.

- Il titanio e le sue leghe hanno una lavorabilità scarsa rispetto agli acciai di tipo generico e agli acciai inossidabili.

Il titanio ha una scarsa conducibilità termica; mantiene la sua resistenza alle alte temperature, il che genera forze di taglio elevate e calore in corrispondenza del tagliente.

I trucioli prodotti durante la lavorazione sono sottili e molto spezzettati, con tendenza ad escoriare la superficie lavorata, e generano forze di taglio concentrate in prossimità del tagliente.

La forza di taglio può variare da 1300-1400 N/mm<sup>2</sup>.

## Super alloys - HRSA and titanium alloys (ISO S)

This group contains Super alloys based on heat-resistant iron, on nickel and cobalt (HRSA) and on titanium alloys.

- The super alloys have a high resistance to corrosion and this allows to maintain their hardness and resistance to high temperatures (up to 1000 °C).

The nickel-based version is the most widely used. Among the precipitation hardening materials we find: Inconel, Waspalloy, Udimet. Among the hardened materials for solubilization (not hardenable) we find Inconel 625.

The materials based on iron are derived from the austenitic stainless steels and are those that have a weak resistance to heat.

The workability is improved in the case of alloys based on iron and is lower in the case of alloys based on nickel and cobalt based.

As these materials have a high resistance to high temperatures during processing are produced segmented chip.

The cutting force can vary from 2400-3100 N/mm<sup>2</sup>.

The considerable resistance, the tendency to strain hardening and hardening cause the phenomena of adhesion wear of the cutting edge.

- The titanium and its alloys have a poor workability compared to generic type steels and stainless steels.

Titanium has a low thermal conductivity; it keeps its strength at high temperatures, which generates high cutting forces and heat in correspondence of the cutting edge.

The chips produced during machining are thin and very fragmented, with a tendency to excoriate the machined surface and generate shear forces close to the cutting edge.

The cutting force can vary from 1300-1400 N/mm<sup>2</sup>.

## Leghe leggere/materiali non ferrosi (ISO N)

Questo gruppo contiene metalli teneri, non ferrosi, con durezza inferiori a 130 HB, ad eccezione dei bronzi ad alta resistenza (>225 HB)

Il gruppo più consistente è rappresentato dalle leghe di alluminio (Al) con meno del 12-13% di silicio (Si), il rame e le sue leghe: ottone (CuZn), bronzo (CuSn), leghe di magnesio ed infine i materiali plastici.

La lavorazione di queste leghe produce normalmente truciolo lungo.

La forza di taglio può variare da 350-700 N/mm<sup>2</sup>

L'Alluminio puro è tendente all'incollamento e richiede taglienti affilati e alta velocità mentre l'alluminio eutettico con tenore di Si superiore al 12% è molto abrasivo.

### Light alloys/non-ferrous materials (ISO N)

This group is made of soft metals, non-ferrous, with hardness less than 130 HB, with the exception of the bronzes at high resistance (> 225 HB)

The largest group is represented by alloys of aluminum (Al) with less than 12-13% of silicon (Si), copper and its alloys: brass (CuZn), bronze (CuSn), magnesium alloys and finally the plastic materials.

Usually the processing of aluminium alloys produces long chip.

The cutting force can vary from 350-700 N/mm<sup>2</sup>

The Pure aluminum is tending to stick and requires sharp cutting edges and high speed while the eutectic aluminum with content of Si more than 12% is very abrasive.

ISO	Gr.	Esempio/Example	W.-Nr	AISI/SAE
N	1	Al99.5	3.0255	1000
		AlCuMgPb	3.1645	
		AlMg 1	3.3315	5005
		AlMg 5	3.3555	
	2	AlSi9 Mg	3.2373	
		AlSi17Cu5		
		AlSi10Mg		
		AlSi 7 Mg		
	3	AlSi17Cu4Mg		
		AlSi18CuNiMg		
		AlSi21CuNiMg		
	4	CuZn20	2.0330	
CuSn2				
CuNi 18 Zn 19 Pb				
CuZn 36 Pb 1,5				
CuZn 40 Al2		2.0550		

La grafite e i compositi in carbone non sono materiali metallici.

The graphite and carbon composites are not metallic materials.

ISO	Gr.	Esempio/Example	W.-Nr	AISI/SAE
O	1	CKF

Per l'alluminio puro i parametri possono essere aumentati del 50%

- ! **SERIE LUNGA** Diminuire l'avanzamento (F) del 40% e la velocità di taglio (Vt) del 20% -
- SERIE EXTRA-LUNGA** Diminuire l'avanzamento (F) del 60% e la velocità di taglio (Vt) del 20%

Parameters for pure aluminium can be raised by 50%

- ! **LONG SERIES** Please reduce the value of the feed (F) of 40% and cutting speed (Vt) of 20%
- SERIE EXTRA LONG** Please reduce the value of the feed (F) of 60% and cutting speed (Vt) of 20%

## FAQ

### FAQ - Frequency Answer Question

#### Scheggiatura del tagliente

##### Possibili azioni risolutive

- Diminuire l'avanzamento per dente
- Aumentare la velocità di taglio
- Verificare rigidità della macchina
- Verificare Run-out utensile
- Verificare scelta appropriata della geometria dell'utensile
- Difficoltà nell'evacuazione del truciolo, verificare percorso utensile e pressione o direzione del refrigerante.

#### Usura del tagliente

##### Possibili azioni risolutive

- Diminuire la velocità di taglio
- Aumentare l'avanzamento per dente
- Utensile con materiale poco resistente all'usura, utilizzare Metallo Duro o Acciaio con caratteristiche maggiori di resistenza all'usura
- Verificare scelta appropriata della geometria dell'utensile
- Verificare scelta appropriata del rivestimento

#### Craterizzazione del tagliente

##### Possibili azioni risolutive

- Diminuire la velocità di taglio
- Diminuire l'avanzamento a dente
- Utensile con materiale poco resistente all'usura, utilizzare Metallo Duro o Acciaio con caratteristiche maggiori di resistenza all'usura
- Aumentare il flusso/pressione di refrigerante
- Verificare scelta appropriata del rivestimento

#### Tagliente di riporto

##### Possibili azioni risolutive

- Diminuire la profondità di passata
- Aumentare la velocità di taglio
- Aumentare l'avanzamento per dente
- Aumentare flusso/pressione refrigerante

### Scarsa finitura superficiale

#### Possibili azioni risolutive

- Diminuire avanzamento per dente
- Diminuire la fase del tagliante
- Diminuire la profondità di passata
- Aumentare la velocità di taglio
- Verificare la rigidità della macchina
- Utilizzare fresa con angolo elicà più accentuato
- Utilizzare fresa con numero maggiore di taglianti
- Verificare Run-out della fresa

### Presenza di vibrazioni durante la lavorazione

#### Possibili azioni risolutive

- Diminuire la profondità di passata
- Diminuire la velocità di taglio
- Valutare la stabilità della macchina
- Verificare la stabilità del pezzo
- Verificare la densità del refrigerante
- Utilizzare una fresa con più denti
- Usare una fresa più corta
- Utilizzare una fresa a divisione irregolare
- Diminuire l'angolo di spoglia

### Mancata precisione dimensionale

#### Possibili azioni risolutive

- Diminuire profondità della passata di taglio
- Migliorare rigidità del mandrino e della pinza di fissaggio
- Utilizzare una fresa con più denti

### Truciolo lungo (gomitolo)

#### Possibili azioni risolutive

- Ridurre avanzamento o velocità
- Utilizzare una fresa con meno denti
- Aumentare il flusso del refrigerante
- Provare geometrie diverse del tagliante

### Sbavature

#### Possibili azioni risolutive

- Anticipare la riaffilatura
- Correggere i parametri e l'angolo di taglio

### Rottura della fresa

#### Possibili azioni risolutive

- Ridurre velocità ed avanzamento per dente
- Utilizzare una fresa più corta
- Anticipare riaffilatura
- Verificare tenuta mandrino
- Verificare Run-out

### Presenza di scheggiature sul pezzo

#### Possibili azioni risolutive

- Diminuire l'avanzamento per dente
- Diminuire la profondità di passata
- Diminuire la fase del tagliante

### Sovraccarico della macchina

#### Possibili azioni risolutive

- Diminuire la velocità di taglio
- Diminuire l'avanzamento per dente
- Diminuire la profondità di passata
- Sostituire l'utensile con uno che abbia una geometria più idonea

### Non perpendicolarità della parete

#### Possibili azioni risolutive

- Verificare la concentricità della fresa sulla macchina
- Diminuire la velocità di taglio
- Diminuire profondità e larghezza di taglio
- Diminuire la lunghezza totale
- Utilizzare una fresa con più denti

### Edge chipping

#### Possible corrective actions

- Decrease feed per tooth
- Increase the cutting speed
- Check rigidity of the machine
- Check run-out of the cutter
- Ensure appropriate choice of cutter geometry
- Difficulties in the evacuation of the chip: please test the cutter path or direction and pressure of the refrigerant

### Tool wear

#### Possible corrective actions

- Reduce the cutting speed
- Increase feed per tooth
- Cutter with carbide material of low resistance to wear, please use carbide with most features of wear resistance
- Ensure appropriate choice of cutter geometry
- Ensure appropriate choice of the coating

### Edge cratering

#### Possible corrective actions

- Reduce the cutting speed
- Decrease the feed per tooth
- Cutter with carbide material of low resistance to wear, please use carbide with most features of wear resistance
- Increase the flow/pressure refrigerant
- Ensure appropriate choice of the coating

### Up edge

#### Possible corrective actions

- Decrease the depth of cut
- Increase the cutting speed
- Increase feed per tooth
- Increase flow/pressure refrigerant

### Poor work piece surface

#### Possible corrective actions

- Decrease feed per tooth
- Decrease the depth of cut
- Increase the cutting speed
- Check the rigidity of the machine
- Use a cutter with helix angle sharper
- Use a cutter with greater number of cutting edges
- Check the run-out of the cutter

### Presence of vibration during machining

#### Possible corrective actions

- Decrease the depth of cut
- Reduce the cutting speed
- Check the stability of the machine
- Check the stability of the piece
- Check the refrigerant density
- Use an end mill with more teeth
- Use a shorter cutter
- Use a cutter with irregular division
- Decrease the rake angle

### Presence of chips on the piece

#### Possible corrective actions

- Decrease feed per tooth
- Decrease the depth of cut
- Decrease the phase of the cutting edge

### Overload the machine

#### Possible corrective actions

- Reduce the cutting speed
- Decrease feed per tooth
- Decrease the depth of cut
- Replace the tool with one that has a geometry more suitable

### Do not perpendicular wall

#### Possible corrective actions

- Check the concentricity of the cutter on the machine
- Reduce the cutting speed
- Decrease depth and width of cut
- Decrease the total length
- Use cutter with more teeth

### No dimensional accuracy

#### Possible corrective actions

- Decrease depth of the cutting pass
- Improve the rigidity of the spindle and the clamp
- Use cutter with more teeth

### Chip forming ball

#### Possible corrective actions

- Reduce feed or speed
- Use cutter with less number of teeth
- Increase the flow of the refrigerant
- Try different geometries of the cutting edge

### Flash

#### Possible corrective actions

- Anticipate regrinding
- Correct the parameters and the cutting angle

### Broken cutter

#### Possible corrective actions

- Reduce speed and feed per tooth
- Use a shorter cutter
- Anticipate regrinding
- Check the spindle
- Check the run-out

**ATTENZIONE:** i suggerimenti dati sono puramente indicativi e non garantiscono la risoluzione del problema che potrebbe essere creato da molteplici cause. Per una conferma sulla scelta dell'utensile e sull'analisi della problematica vi invitiamo a contattare l'ufficio tecnico Rime per una risposta più precisa.

**WARNING:** the suggestions given are for guidance only and do not guarantee the resolution of the problem that could be created by multiple causes. In order to have the confirmation of the selection tool and analysis of the problem, please contact the RIME technical department for a more precise answer.

# CONDIZIONI DI VENDITA

## SALES CONDITIONS

**PREZZI:** sono indicativi e non impegnativi. In ogni caso avranno valore quelli vigenti al momento della spedizione.

**SPEDIZIONI:** la merce, salvo espressa pattuizione contraria, viene fornita franco nostro stabilimento o deposito; essa viaggia sempre in ogni caso ad esclusivo rischio e pericolo del Committente.

Per esigenze di costi di magazzino e di fatturazione, non consegnamo merce per importi inferiori a Euro 100 .

**TERMINI DI CONSEGNA:** sono approssimativi e comunque mai impegnativi. Essi sono inoltre subordinati al normale rifornimento delle materie prime nonché ad impedimenti di produzione per cause di forza maggiore. I giorni si intendono lavorativi e decorrenti dalla data della nostra accettazione dell'ordine.

**RECLAMI:** dovranno pervenire per iscritto entro gli otto giorni dal ricevimento della merce.

**GARANZIA:** in normale uso. Provvederemo a sostituire gratuitamente gli utensili da noi riconosciuti difettosi. La stessa non si estende agli utensili che presentino una normale usura, segni di manomissione o di errato impiego.

**FORO COMPETENTE:** per ogni controversia viene riconosciuta la esclusiva competenza del Foro di Brescia.

**PRICES:** are indicative and not binding. In any case the rate will be the one commonly in use at the sending time.

**SHIPMENTS:** the goods, except different agreement, is provided ex our works and is transported at risk and danger of the purchaser. We don't deliver order less than Euro 100 because of the invoicing and stock costs.

**DELIVERY CONDITIONS:** are approximated and not binding. The delivery is subjected to usual raw materials supplying and unforeseen event during the production.

**COMPLAINTS:** it must be written and sent withing 8 days since the goods receiving.

**GUARANTEE:** normally in use. Free replacement when the tool is acknowledged defective. The guarantee doesn't apply in case of usual wear, wrong use and proof of tampering.

**JURISDICTION:** any controversy is subjected to the Court of Brescia's jurisdiction.
